

Preparing SSIS Solutions for Azure Deployment

Chris B. Behrens

SOFTWARE ARCHITECT

@chrisbbehrens

Azure Integration Services

If you Google “Azure Integration Services”

What comes up is NOT Integration Services in Azure

But, let's be honest – “integration services” is a terrible name

<https://azure.microsoft.com/en-us/product-categories/integration/>

Data Transformation Services

The OG name for Integration Services

So let's figure out what actual
“Azure Integration Services”
would look like

Connection from a Local Machine to an Azure Database

Lift and Shift to Azure Data Factory

Azure Data Factory – the real Azure Integration Services

A cloud-based pipeline

“Migrating to Azure Data Factory” - <https://bit.ly/3bJGlgM>

Developing in ADF from the Start

Azure Data Factory 1.0

ADF 1.0 was unusable

**Don't let that keep you from
looking at 2.0**

Emotional Permission with SSIS

SSIS has a lot of problems, most of which seem like chip-shots that could be solved over a weekend

These problems have persisted over multiple versions – Microsoft has clearly decided to never fix them

An Eye on the Big Picture

If an ETL process
is going to be
ruinously
expensive...

Maybe you
shouldn't have a
database

Unask the
question

How Do You Store Data without a Database?

Traditional, transactional databases are *schema-on-write*

This is what makes ETL so hard

Document-oriented databases are *schema-on-read*

This shifts the complexity from the ETL process to the data layer – maybe a better place for it?
